Motivation

New Primer features for seat and dummy

- Seat positioning**
- Dummy positioning**
- Seat foam compression**
- Model organisation**
- IPP impact**

Conclusions

6th European LS-DYNA Conference 2007

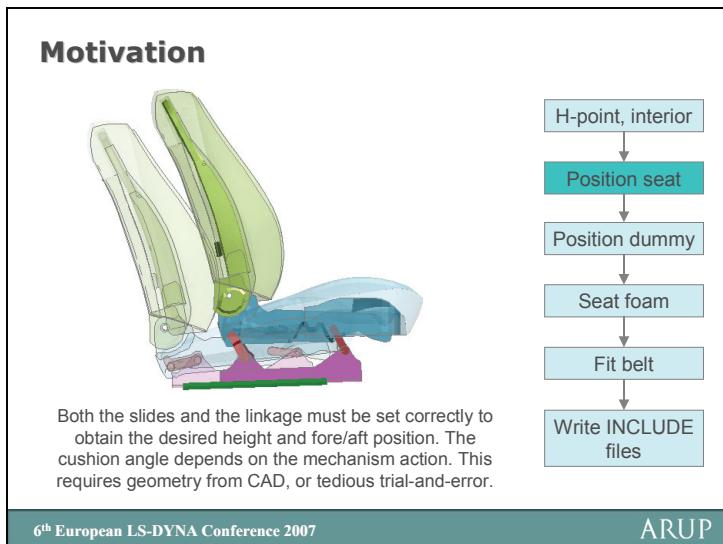

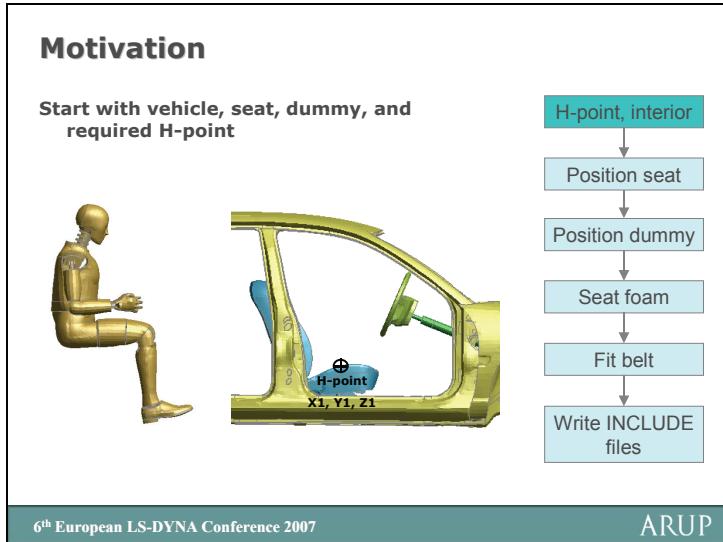

ARUP

Abstract

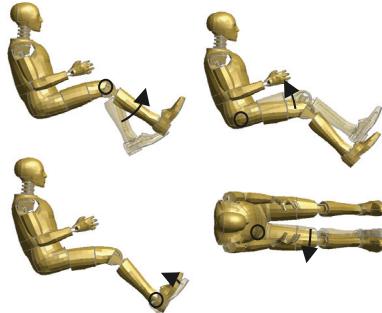

- There is constant pressure to reduce the time needed to process design data into crash results (mesh, assemble, create different crash cases, check, run, post-process). The meshing step has been reduced by batch meshing technology, and progress has been made in several other areas such as automatic post-processing. Attention is now turning to the remaining bottlenecks, which include occupant and seat positioning. These steps require careful manual work and cannot currently be automated. The problem is magnified by the large number of seat position/dummy combinations.
- It is intended that Primer Version 9.3 will solve these problems, by providing fast methods of dummy positioning, seat positioning, seat foam compression, and belt fitting.

Motivation

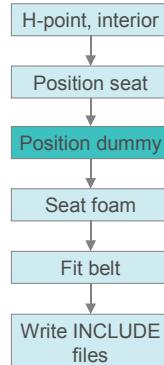

- **Crash model assembly:**
 - 30-40 full vehicle crash cases, of which at least half include a dummy
 - Some crash cases must be analysed with several dummy and seat positions (front/mid/rear, highest/mid/lowest, etc)
 - Consider also analysis for restraints and interiors (cockpit/HYGE sled type), FMVSS 208, etc
- **Total number of seat/dummy/belt/position combinations typically 20-40**
 - When the design changes, some or all of these must be re-assembled
- **Total man-time spent on dummy/seat model assembly tasks can be 1 to 4 weeks per design iteration**
- **This time has not reduced, while meshing and other tasks are now very much quicker**
- **We aim to cut this time by 5x or 10x.**

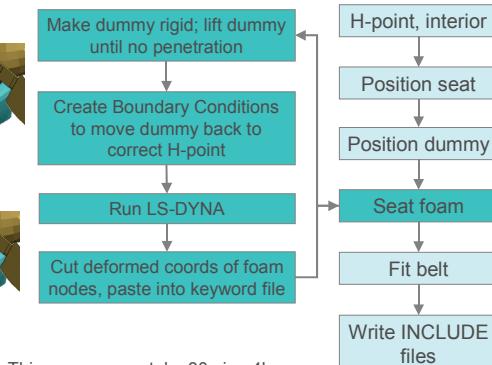

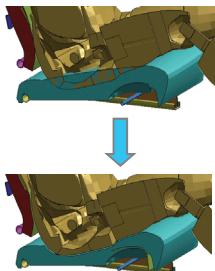

Motivation

The foot position is determined by the combined effect of 7 joint rotations. Rotating each joint in turn (the usual method), it is difficult to control the final position of the foot, e.g. to place the foot on the footrest. Similarly, the hand position is determined by 6 joint angles.

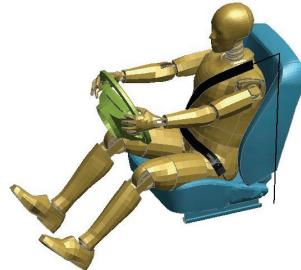

Motivation

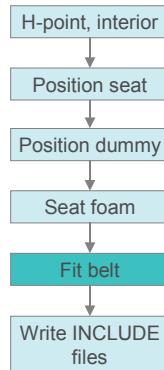

This process can take 30mins-4hrs per dummy/seat combination

Motivation

Belt-fitting takes about 10-20mins but must be repeated for each dummy and each position

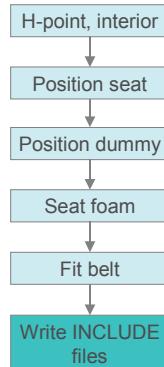

6th European LS-DYNA Conference 2007

ARUP

Motivation

We now have a data management exercise to ensure that every analysis uses the correct INCLUDE files.

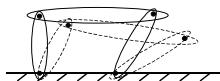

6th European LS-DYNA Conference 2007

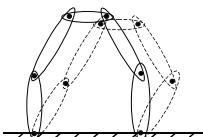

ARUP

Mechanisms

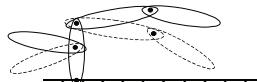

Determinate: 1 DoF

Indeterminate: >1 DoF

Tree: DoF = No. of joints

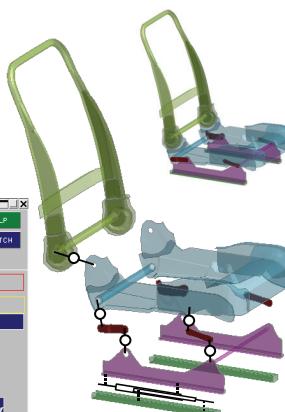

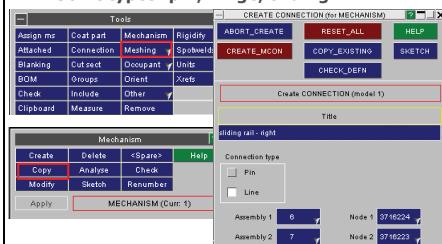

- Need to solve to find possible joint angles or part positions
- Matrix methods available from robot technology – well suited to determinate systems
- Iterative methods are more CPU-intensive but cope better with nonlinearities such as joint stop-angles, contact, etc.
- Primer now has an iterative mechanisms solver.

6th European LS-DYNA Conference 2007

ARUP

Mechanism definition

- New menu to create mechanisms – can also create dummy tree file
- Assemblies identified by Parts or Part Sets, e.g. back, squab, front and rear links, etc
- Joints defined at picked node – an LS-DYNA joint is not necessary
- Joint types: pin, hinge, sliding

6th European LS-DYNA Conference 2007

ARUP

Application to seats

- “Analyse” function offers list of assemblies with translational and rotational restraints.
- Depending on restraints, we can drag just the slides, just the 4-bar linkage, or both.

Assembly	Lock translational	Lock rotation
Seat back	T all T T	R all R R R
Bum section	T all T T	R all R R R
Link front right	T all T T	R all R R R
Link front left	T all T T	R all R R R
Link back left	T all T T	R all R R R
Link back right	T all T T	R all R R R
Sliding base	T all T T	R all R R R
Fixed base	T all T T	R all R R R

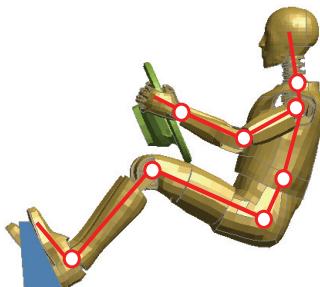

6th European LS-DYNA Conference 2007 ARUP

Application to seats

- Mechanisms may contain named reference points (e.g. H-point)
- Another option for positioning is to type the new coordinates of the reference point
- This method will be available in command files

6th European LS-DYNA Conference 2007 ARUP

Application to dummies

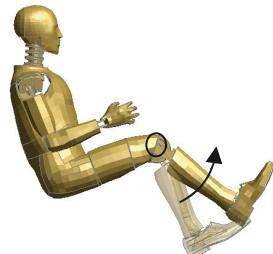

- A dummy is also a mechanism.
- Typically it is under-constrained – several different configurations are possible for any given position of hand, foot, etc
- We may want to restrain different parts of the dummy; then it may become determinate, or over-constrained.
- Primer can use the dummy's tree file to enable the dummy to be treated like a mechanism.
- Joint stop-angles are important, and the user may want to opt to consider contact while dragging.

6th European LS-DYNA Conference 2007

ARUP

Application to dummies

- Primer's existing menu for rotating dummy's joints
- To use the new "mechanism" capability, simply switch to Drag Assembly. Primer generates the necessary data automatically using the dummy's tree file.

Dummies		
Selected dummy	Translate	Status
Move parts	Rotate	Units
Set t-point	Scale	Help
Curr: M10/DUMMY1 - Hgt:229.233 326.4997 514.837		
Position parts		
<input type="checkbox"/> Rotate angles	<input type="checkbox"/> Finish set parts	
<input checked="" type="checkbox"/> Drag assembly	<input type="checkbox"/> Reset all	
Assembly:		
	-Phi	-Psi

6th European LS-DYNA Conference 2007

ARUP

Combined mechanisms

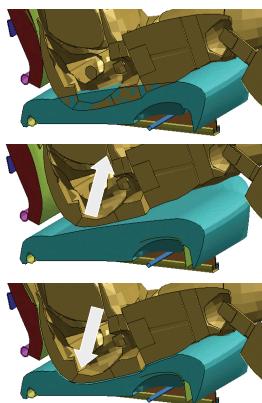

- One mechanism may be linked to another, e.g. seat squab to dummy pelvis. Then the dummy and seat can be dragged together in a single action.
- It will be possible to set a new H-point position simply, interactively or in a command file.
- Could also add steering column as a mechanism

6th European LS-DYNA Conference 2007

ARUP

Seat foam compression

Attribute	Connection	Mapping	Upgrades
Blanking	Cut seat	Occupant	Units
BOM	Groups	Airbag	+
Check	Include	Dummies	
Clipboard	Measure	FIM	
	Keys	Seatbelt	
AIRBAG	DATABASE	Squat	ART
ALE	DEFINE	INTRODC	ZIP MODES

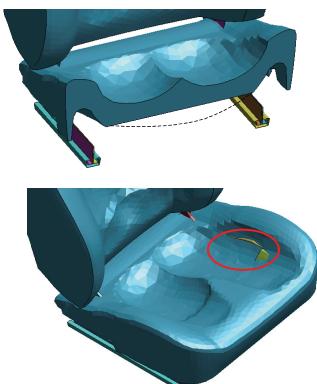

New feature in Primer:

- Dummy has been positioned, penetrating the foam
- User invokes Seat Squash feature, selects the dummy/seat contact and the top and bottom surfaces of the foam.
- Primer raises dummy until there are no penetrations.
- Primer pushes the dummy back down, compressing the foam evenly to prevent penetrations.

6th European LS-DYNA Conference 2007

ARUP

Foam compression - remaining issues

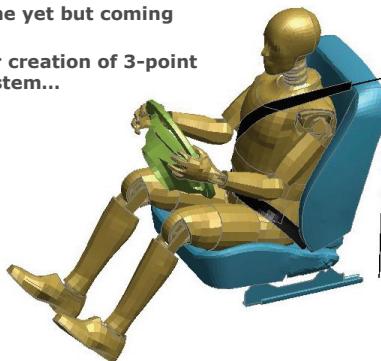

- How to allow suspension to deform?
- Detecting when the requested occupant position penetrates the seat structure
- Element quality checks and prevention of excessive deformation
- Effects of precompression on material properties: some of the crush is used up
- Initial stress considerations:
 - Actual strain distribution should depend on material properties
 - For equilibrium, we should also precompress the dummy and use gravity
 - To perform precompression properly will require LS-DYNA run

6th European LS-DYNA Conference 2007

ARUP

Belt fit & re-fit

- Not done yet but coming soon:
- Quicker creation of 3-point belt system...

6th European LS-DYNA Conference 2007

ARUP

Belt fit & re-fit

- Reposition dummy and seat...

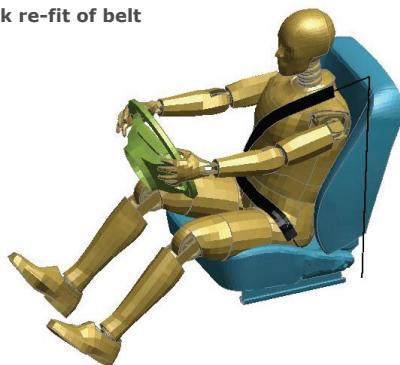

6th European LS-DYNA Conference 2007

ARUP

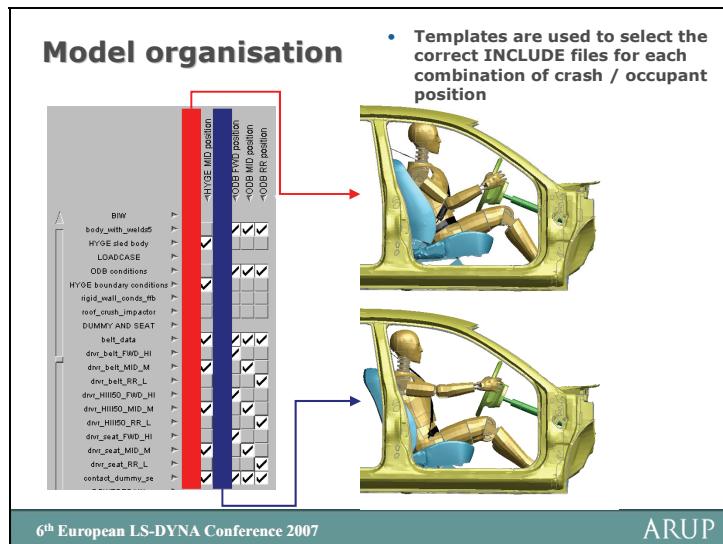

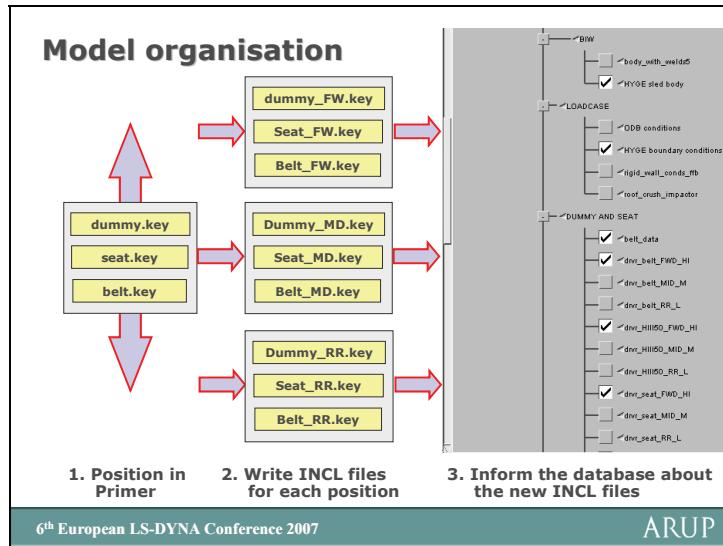

Belt fit & re-fit

- Very quick re-fit of belt

6th European LS-DYNA Conference 2007

ARUP

Model organisation

- Version control has been introduced for Primer 9.3.
- Each database entry (e.g. Steering Column) can have several INCLUDE files, each representing a different version or design level (e.g. "Gateway A", "Gateway B", "Latest").
- When assembling models, the user can select the version for the whole model, or for individual components. Thus you could choose to build "Gateway A" condition, except for the Steering Column for which you use "Gateway B"

The screenshot shows the 'Edit existing database entry' dialog. In the 'Keyword file:' dropdown, 'LESTRIMicolumnX_gateB.key' is selected. Below it, 'selected version' is set to '2: Gateway B'. A list of versions is shown: 1: Gateway A, 2: Gateway B, and 3: Latest. To the right of the list are four 'History' buttons. At the bottom right of the dialog is a 'Thumbnail' button.

1: Gateway A	O_MODELINCLUDE_FILE\$TRIMicolumnX_gateA.key	<input type="button" value="History"/>
2: Gateway B	O_MODELINCLUDE_FILE\$TRIMicolumnX_gateB.key	<input type="button" value="History"/>
3: Latest	MD_MODELINCLUDE_FILE\$TRIMicolumnX_022.key	<input type="button" value="History"/>

ARUP

Instrument Panel Pendulum Impact

A 3D model of an instrument panel pendulum impact setup. Several target points are marked with red spheres and labeled with letters A through H. A coordinate system (x, y, z) is shown at one of the points.

New feature – “IPP” model setup

- Target point definition & storage in model
- Position & depenetrate any impact point
- Batch process and multi-point auto-process

The screenshot shows the 'IPP TARGETING PANEL' dialog. It lists 10 target points with their coordinates and a 'pick' status. The last two rows are highlighted in yellow.

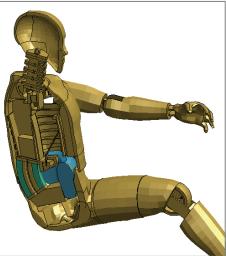

name	position	pick
1	2181.2 -78.4 922.8	pick
2	2139.2 -445.2 270.2	pick
3	2122.4 -445.2 270.2	pick
4	2050.0 -46.2 211.6	pick
5	2172.3 -366.9 917.7	pick
6	2116.4 -277.7 897.6	pick
7	2181.2 -78.4 922.8	pick
8	2181.2 -78.4 922.8	pick

6th European LS-DYNA Conference 2007

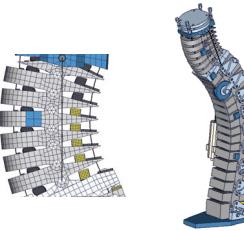

ARUP

Future: Positioning deformable dummies?

- In future we want to position deformable parts of dummies
 - Bend lumbar spine
 - Compress foam
- Consider also human models and complex dummies such as BioRID
- Problem 1: positioning Problem 2: prestress

BioRID spine Courtesy of Dynamore

6th European LS-DYNA Conference 2007

ARUP

Conclusions

- Time taken to assemble and position occupant models is greatly reduced using Primer 9.3
 - Dummy positioning by dragging, while fixing selected parts
 - Seat mechanism definition and positioning by dragging or input of XYZ
 - Linked motion of mechanisms, e.g. dummy/seat/steering column
 - Seat foam compression
 - Belt re-fitting
 - Assembly of many crash cases including version control
 - Pendulum impact on IP

6th European LS-DYNA Conference 2007
