Find and remove crossed edges and initial penetrations

Courtesy of LS-DYNA Support Site www.lsdynasupport.com

How to find and remove crossed edges and initial penetrations in a LS-DYNA keyword model using LS-PREPOST 2.0 after 2005-11-05.

What is a penetration?

Crossed edges

The case where an edge of an element crosses another shell element mid surface, or face on a solid element, is not a penetration in a classical sense in LS-DYNA. But these mesh errors might lead to severe problems when running an analysis in LS-DYNA so it is very important that such modeling is avoided. Figure 1 shows a case where two shell element crosses each other. The contact thickness of the elements including the virtual contact cylinders on the edges of the shell is displayed. Crossed edges are shown in red color. This is *not* considered as a *penetration*.

Figure 1. Crossed edges

Node-edge penetration

All *CONTACT_AUTOMATIC contacts in LS-DYNA includes a virtual contact cylinder around each edge. A node can pene-

trate such virtual contact cylinder. This is considered as a *penetration*.

Figure 2: Node penetrating an shell edge

Edge-edge penetration

Some contact definitions in LS-DYNA, such as *CONTACT_GENERAL includes edge to edge contact. For these kind of contacts, the following images shows edge to edge *penetrations*.

Figure 3: Shell edge to edge penetration (and crossed edge situation)

Figure 4: Shell edge to edge penetration (but no crossed edges)

Node-surface penetration

If a node is within contact distance to a shell there is a *penetration*.

Figure 5: A node is penetrating a shell element

A node inside a solid element is also a *penetration*.

Figure 6: A node penetrating a solid element

Finding crossed edges in LS-PREPOST 2.0

The function to find and remove initial penetrations exist in panel 5, IniPene. The hood on the C2500 NCAC model will be used for demonstrating IniPene functions.

Figure 7: The hood of NCAC C2500 model

Check for crossed edges

The first thing to do is to ensure that no crossed edges exists. This is what is set as default action in the IniPene interface when entering the panel. Select the parts you wish to check for crossed edges and click "Check" at the bottom of the interface.

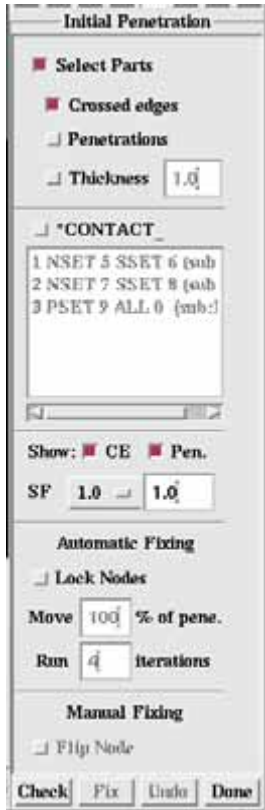

Figure 8: The IniPene interface

Even self intersecting parts will be detected in LS-PREPOST. 21 crossed edges are found on the two parts on the hood. The edges that cross other elements are highlighted, see image below. The highlighted crossed edge can be visually turned off by untoggle "Show: CE" (CE = crossed edges).

Figure 9: Crossed edges on C2500 hood

Remove crossed edges

To remove the crossed edges, toggle the "Flip Node" and pick the nodes that are on the wrong side, here nodes 84462 and node 84464 are shown to be on the wrong side.

Figure 10: Crossed edges on the front of the hood

When a node is picked in the "Flip Node" mode, it is moved to the other side of the closest *visible* element. It is moved in the direction of the closest point on the closest visible element and moved $(t_1+t_2)/2$. past the mid surface.

Figure 11: The two nodes at the front have been flipped to the opposite side.

Select all nodes that should be flipped to the opposite side and redo the crossed edge by Selecting Parts and click "Check", to ensure that all crossed edges are removed. The hood is now free from crossed edges.

Penetration check

In LS-PREPOST you can choose to check penetrations on selected parts by toggle the "Select Parts" **OR** you can check existing contact definitions in the keyword file by toggle the "*CONTACT_" and select the contact you wish to check from the list of contacts. Penetrations are checked for shell, beam and solid elements.

Penetration check by "Select Parts"

This option is useful if you not yet have created any contact definitions. Contact thickness for this check is taken from section card data unless the "Thickness" toggle is activated. If "Thickness" is toggled, all shell and beam elements will get the user-specified contact thickness, solid elements have zero thickness. The check that is performed follows the same rules as *CONTACT_GENERAL would do, i.e. it will check for node-to-surface, free_edge-to-free_edge and node to edge penetrations for all parts to all parts (including self contact).

Penetration check by CONTACT

By selecting a contact from the list of defined contact in the model, the elements included in the contact are displayed and the check is performed by taking care of all parameters that affects the contact thickness (SST, MST, SFST, SFMT, SHLTHK, SLDTHK, SSTHK, OPTT, SFT, TH, TH_SF) and which nodes/elements is to be checked against penetration to which elements.

Penetration check on the hood of C2500 model

Selecting the two parts on the hood and activating the "Penetration" toggle displays penetrating nodes with white squares and arrows proportional to the penetrating distance. 25 node to surface and 12 edge to edge penetrations are reported together with the maximum penetration distance. Nodes on edge to edge penetrations are reported in the same way as a node to surface penetrations. The displayed penetrations can be visually turned off by untoggle "Show: Pen." (Pen. = Penetrations)

Figure 12: Penetrations on C2500 hood

Removing initial penetrations in LS-PREPOST

Penetrations can automatically be removed by moving the penetrating nodes in the direction *away* from the penetration. In LS-PREPOST you can move the penetrating nodes a percentage of the *per node* penetrating distance. The default is to move 100% of the penetration distance. This will move a node, such as the one shown in Figure 5, exactly out of penetration. No more no less.

But if two shell elements are parallel and penetrating, as shown in Figure 13, and nodes all penetrating nodes are moved 100% of the penetrating distance there will be a gap between the two elements. In this case, moving 50% of the penetra-

tion distance moves the nodes just out of penetration. To be sure that no gap remains after removing penetrations, use "Move **50%** of pene." and let LS-PREPOST iterate until all penetrations are removed.

Figure 13: Two parallel shells penetrating each other

Any nodes can be prohibited to move during automatic fixing of penetrations in LS-PREPOST. This is done by toggle the "Lock Nodes" and select the nodes that you don't allow LS-PREPOST to move. These nodes will not be moved by LS-PREPOST. For the hood example, all nodes on the outer part is locked by toggle "Lock Nodes" and select the nodes By Part, pick the part, then click "Fix" and LS-PREPOST will move all penetrating

nodes that are not locked out of penetration. The hood is now free from penetrations.

If a node is locked *and* penetrates another element, the nodes on the penetrated element are moved so that the locked node becomes free from penetration. For example, the penetrating node in Figure 14 *is locked* by the user, then all nodes on the lower elements are moved down out of penetration the same distance as the locked node would had been if it was not locked. This is the only case where non-penetrating nodes are moved.

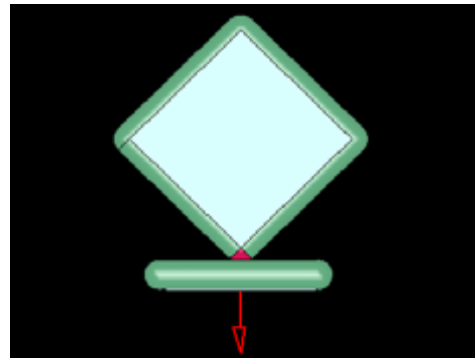

Figure 14: A locked node penetrates a shell element

Challenges in Biomedical Engineering Analysis.

© Copyright ANSYS Inc.

ANSYS Solutions find applications in various areas of biomedical engineering.

These applications range from implantable pacemakers, pacing leads, tip anchoring configurations, heart valves, ablative catheters, angioplasty balloons and stents, drug pumps, blood pumps, oxygenators, orthopedic applications, implantable dental prosthesis, and other devices.

These applications typically require modeling of multiple components with nonlinear materials, complex geometries, and surface-to-surface contacts, as well as coupled conditions that may involve simultaneous mechanical, thermal, electromagnetic loading and fluid-structure interaction. In addition biomedical applications have geometries which require advance and robust meshing needs. Biomedical applications also require advance fluid dynamics capabilities to handle fluid and particle flow in devices such as heart pumps, inhalers etc. ANSYS technology offers solutions which meet all these requirements for analysis of biomedical equipment and devices through advance technologies from ANSYS Multiphysics, ANSYS ICEM CFD and ANSYS CFX products.

ANSYS Multiphysics capabilities range from a full complement of nonlinear and linear elements, material laws ranging from metal to rubber, and the most comprehensive set of solvers available. It can handle even the most complex assemblies—especially those involving nonlinear contact and is the ideal choice for determining stresses, temperatures, displacements and contact pressure distributions on all your component and assembly designs. In addition the nonlinear

solution capability offers the added advantage of fundamental coupled-field studies involving acoustic, piezoelectric, thermal/structural and thermal/electric analysis and fluid structure interaction.

Analysis of Stent deployment using Shape Memory Alloy Material model in ANSYS

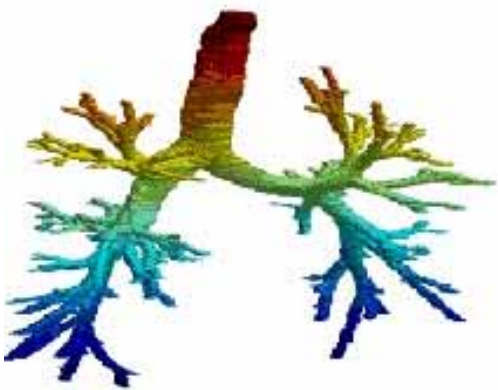

ANSYS ICEM CFD's highly automated mesh generation tools cater to virtually all topologies including all hexahedral, all tetrahedral, hybrid hex/tet element meshes, or Cartesian meshes. Additional elements that can be generated include prism and pyramid cells.

The anatomical complexity and the irregularity of the shapes always make meshing a critical task in the development of models for biomedical applications. Typical objects that are meshed are bones, organs and complex devices. The geometrical data is typically reconstructed based on medical imaging (MRI or CT scans) for some of these applications. Technologies, like the one in ICEMCFD Hexa allows separation of the search for an acceptable meshing topology from the meshing generation itself. Combined with the top - down approach

and easy block editing, it allows one to try various meshing topologies very quickly independently from the mesh density, change the element density easily without changing the topology and use similar blocking for different individuals.

ANSYS CFX technology has been shown to be an important tool in identifying and improving new products in diverse healthcare industries including pharmaceuticals, biomedical, medical equipment, and other "quality-of-life" personal products. ANSYS CFX technology offers advanced modeling and solver capabilities like turbulence models, multiphase flow and mesh morphing to handle flows in these applications.

In addition to the ANSYS Workbench provides a common architecture for all ANSYS solutions and bidirectional associativity with CAD for a parametric analysis during simulation. The ease of use within Workbench allows simulation to be moved up-front in the design process where CAD users can see the results of a simulation and use this knowledge in the CAD design.

ANSYS CFX simulates the 3-D flow of air and drug through the tracheo-bronchial tree during the breathing cycle. CFX's multiphase models predict the motion of aerosol droplets and drug particles and their deposition on the surfaces of the airways.

Case-in-Point 1:

ANSYS helps determine optimal placement of artificial disc and provides valuable insight into spine biomechanics. Researchers at DePuy Spine used ANSYS® Structural™ to model and analyze how well the CHARITÉ artificial disc helps restore motion and how it is affected by its placement relative to the center line of the disc nucleus. To realize their objective, they obtained the contoured geometry of the vertebrae from computer tomography (CT) scans of actual bone structure.

The CHARITÉ artificial disc is designed to eliminate pain and maintain motion of the operative segment. The resulting model was comprised of an assembly of vertebrae, polyethylene core, cobalt chromium endplates, and surrounding tissues such as cartilage, ligaments, and muscle. All parts were modeled using ANSYS standard pre-processing capabilities and analyzed with ANSYS Structural.

The ability of ANSYS to represent the nonlinear material properties of the various components was critical in this study. Moreover, contact representation was aided with ANSYS surface-to-surface contact elements, which automatically detects and adjusts dissimilar meshes instead of requiring users to perform this task manually.

The use of ANSYS simulation enabled researchers at DePuy Spine to determine what constitutes an optimal placement of the artificial disc. The analysis clearly showed that strain and loads on the facets are significantly less with the CHARITÉ artificial disc when compared to a competitive device with a fixed core used for total disc replacement.

Dr. Missoum Moumene who performed this study at DePuy Spine believes this

information will provide valuable knowledge for the continuing development of artificial disc and related technologies. Working with some of the world's most respected spine surgeons, researchers at DePuy Spine are using the results of this study and other simulation-based work to fine-tune procedures and techniques for optimum positioning of the device.

The CHARITÉ artificial disc is the world's first commercially available artificial disc for treating patients with degenerative disc disease. The vertebrae, artificial disc, and surrounding tissue were all modeled using ANSYS standard pre-processing capabilities

Case-in-Point 2:

With Asthma on the increase in the developed world, inhalers and spacer devices are becoming more widespread. In order to control dosage, provide optimum benefits and meet regulations, drug companies are using CFX to simulate gas particle flows in a variety of de-

vices in order to study drug trajectories and their deposition characteristics (external and internal flows); optimize existing device dynamics; rapidly prototype new designs; provide support methodologies for regulatory submissions.

In a recent study, CFX was used to investigate the performance of a Metered Dose Inhaler (MDI). Since flow resistance varies throughout the device and the variation in flow will effect the drug exit profile, CFX was used to predict the flow paths (streamlines) and mouthpiece flow distribution.

Knowing that the final design needed to avoid deposition in the mouth and maximize the drug delivery to the lungs, CFX studied the steady-state air pattern within the inhaler and transport of the drug over a 3-second interval. The final results were obtained within 5 hours (geometry set-up through problem convergence) and showed that the existing design would need to be refined to address mal-distribution. The new design can then be analyzed with CFX providing an optimized design before the costly prototype stage of development.

For children and elderly people who may have difficulties matching their breathing to the MDI, an inhaler spacer device is needed to maximize the dose from their inhaler. Since it is important to know how much of the drug released by the MDI is inhaled by the patient, CFX can be used to model the flow in either steady state or time dependant inhalation cycles. The Lagrangian model was used to track drug particles (in the spacer) with tracers showing the propagation of drug with time. It became evident that restitution and electrostatic effects can be significant.

Air Speed and Concentration Profile in a Metered Dose Inhaler analyzed using ANSYS CFX

SGI® Altix® 4000 Platform – Performance and Flexibility

Revolutionary Platform Delivers New Levels of Performance and Versatility in a Blade Design

Revolutionary standards-based design delivers versatile performance for the most demanding HPC workloads and features new technology that will drive future HPC breakthroughs. SGI Altix 4000 features performance density, 'plug and solve' configurability and continues Altix systems' lead in price-performance for high end servers in a blade form factor.

Altix 4700 Advantages

Modular blade design for superior performance density and "plug and solve" configurability

SGI Altix 4700 platform is comprised of modular blades - interchangeable compute, memory, I/O and special purpose blades for 'plug and solve' configuration flexibility. The innovative blade-to-[NUMALink™](#) architecture enables users to mix and match eight standardized blade choices, for perfect system right-sizing. The compact blade packaging of the Altix 4700 rack also provides excellent performance density.

Designed for future upgrade, expansion and integration of next-generation HPC technologies

Socket-compatible with upcoming single and dual-core Intel® Itanium® 2 processors, SGI Altix 4000 platform offers easy upgrade or expansion of CPU, memory, I/O or visualization capabilities. This flexible growth path makes it possible for customers to adjust system configurations to meet current and changing requirements easily and cost-effectively; minimum risk for maximum productivity.

Scalable system size for simplified programming, low-cost administration and excellent sustained performance for cluster or shared memory applications

SGI Altix 4700 incorporates the shared-memory [NUMAflex™](#) architecture, which simplifies software development, workload management and system administration. It supports up to 512 processors under one instance of Linux and as much as 128TB of globally shared memory. Supporting these powerful capabilities is the [NUMALink™](#) interconnect, which leads the industry in bandwidth and latency for superior performance on cluster applications. The SGI Altix 4700 represents a versatile solution for shared

or distributed memory applications of any scale.

Step into Multi-paradigm computing - taking HPC beyond the Limits of Moore's Law

SGI Altix 4700 Platform also integrates SGI's Peer I/O technology which enables high-speed access to SGI's large shared memory for all system components. Through peer I/O, SGI Altix 4700 is the first SGI platform designed to support new computing paradigms, such as re-configurable computing through SGI RASC™ technology, that will take over where Moore's Law leaves off.

Standards-based platform and blade form factor reduces costs while delivering uncompromised performance on Linux

Like its predecessors, the SGI Altix 4700 platform has been designed specifically for technical users based on industry standard CPU's, memory and I/O. This infrastructure is supported by a complete HPC solution stack running on industry standard Linux® operating systems with the choice of Novell® SUSE LINUX Enterprise Server 9 or Red Hat® Enterprise Linux® Advanced Server 4 operating systems. SGI® ProPack™ software provides the tools and enabling applications to optimize performance for Altix systems running SUSE LINUX OS. All of this is supplied and supported by SGI for one-stop support.

LS-DYNA and SGI Altix System Bundle Available in North America Only

SGI® Altix® systems available with 12, 16, 32 and 64 CPUs

Bundled Price starting at \$57,400* Bundle Includes:

- Paid up LS-DYNA License
- Intel® Itanium® 2 Processors
- Linux® Operating System
- SGI® NUMALink™ Interconnect for Hi-Speed I/O
- Paid up PBS Pro™ License

Ask about our complete solutions with scalable CPU, advanced visualization and data management for workflow process improvements.

Information or Quote Tel: 1-800-800-SGI1 (7441) Email: eleads@sgi.com

*Starting price is in U.S. dollars for an SGI Altix system with 12 Intel Itanium 2 processors, including paid-up LS-DYNA and PBS-Pro licenses. Tax and shipping not included. Bundle only available in North America through Silicon Graphics, Inc. This promotion is limited and subject to change without notice. Certain restrictions apply. Silicon Graphics, SGI, Altix and the SGI logo are registered trademarks and NUMALink is a trademark of Silicon Graphics, Inc. in the U.S. and /or other countries worldwide. Yahoo Group Yammerings - 3

Jim Kennedy
KBS2 Inc.
jmk@kbs2.com

Len Schwer
Schwer Engineering
& Consulting Services
Len@Schwer.net

This installment of "Yahoo Yammerings" features two questions, with responses from the past month of postings to the LS-DYNA Yahoo Group:

1. *Rigid Body Contact*
2. *SPH and Thermal Analysis*

Question: Rigid Material Contact Problem?

I have a complex drop test model in which there are two small components. To maintain a large time step I have defined them as rigid (MAT020) and assigned a single surface automatic contact to the entire model. However these two rigid components are not obeying the contact definition, what could be the problem?

Response by Steve McDonald:

Here's another thing I learned recently by talking to LSTC support: Although it's nice to use rigid bodies to keep time steps large, you still can't use a really large time step, and you can't let LS-DYNA choose its own time step. You really need to use the LCTM argument on the *CONTROL_TIMESTEP card to point to a load curve where you define the maximum time step LS-DYNA will use during the simulation. Then you need to tweak that value of max time step during contact periods to control penetration. When you have no deformable bodies, LS-DYNA will use whatever time step you tell it to use by this load curve. If it is too big, nodes will move too far during a

time step, perhaps right through a contact segment, and then LS-DYNA won't even know that there's been penetration. I would guess that the appropriate time step depends on the impact velocity. Realizing this has been a big help for me, and I've been able to do rigid body simulations with lots of contact pretty successfully, and I use a variety of *CONTACT cards. If I'm lazy and don't care about resolving contact forces on various surfaces, *CONTACT_AUTOMATIC_SINGLE_SURFACE works well, and you don't even have to specify slave and master sets.

Question: Can SPH be used for a coupled structural/thermal analysis?

Can SPH elements be used in a coupled thermal/structural analysis? SPH elements use Johnson Cook material with Gruneisen EOS. We are trying to model temperature-dependent-plasticity.

Response by Rudolf Böttcher:

You cannot have conduction currently. You may test this by making http://www.dynaexamples.com/SPH/SPH/Bar_II/Download/ a thermal deck allow-

ing for plastic heating. "UNCONSTRAINED Thermal Node data" was the error message for the SPH elements/nodes. I know this is only half of the answer, because you possibly did not mean a coupled thermal/structural analysis.

Follow-up by Shekhar Bhojwani:

To further the discussion on this issue, let me also quote from the emails I received from:

J.L. Lacombe (LSTC) (SPH examples author dynaexamples.com) "The coupling between thermal and SPH is still under development. I hope finishing this before the end of this year."

A. Shapiro. (thermal examples author dynaexamples.com) "Coupled thermal-mechanics with SPH is not implemented. However, the Johnson-Cook model allows adiabatic heating without calculating heat conduction."

LS-DYNA Yahoo Groups

There are over 1600 subscribers from all over the world, and this list seems to grow by a hundred new subscribers ever few months; no small testament to the rapidly growing popularity of LS-DYNA. The group currently averages over 250 message per month, i.e. about 10 message per work day. You can subscribe to the group by sending an email request to LS-DYNA-subscribe@yahoogroups.com or by visiting the Yahoo Groups web site <http://groups.yahoo.com>

Generally the quickest/best responses are to those questions posed with the most specifics. General questions such as "How do I use XXX feature?" either go unanswered, or are answered by Jim Kennedy with links to appropriate references in the growing LS-DYNA related literature, e.g. see the archive of LS-DYNA Conference proceedings at www.dynalook.com.

Part 1 HP Flexible Computing Services deliver IT capacity as you need it.

For Information Contact: Bennett Bauer +1 (408) 741-1424
Bennett.bauer@hp.com

(Part 2 Feb – LS-DYNA available on HP Utility)

The early years of the 20th century saw a momentous shift in the way large businesses met their electrical-power requirements. Instead of building and operating their own generators as they had traditionally done, they came to recognize that it was more practical and economical to offload this burden to external service providers and purchase power from them as needed.

Today a similar trend is emerging in the IT arena¹. And the reasons are not far to seek.

As the pace of change quickens, aligning IT supply with business demand becomes more difficult. On the one hand, there's the risk of costly, resource-wasting over-provisioning and underutilization. On the other, there's the risk of running short of compute cycles during peak periods.

Small wonder, then, that many enterprises are beginning to consider alternatives to outright ownership of large IT infrastructures. Increasingly, they're finding that it can be more efficient and economical to complement their internal

capabilities by accessing data center compute capacity as an externally provided "service" they can dial up or down as requirements fluctuate.

HP's Flexible Computing Services are designed to help you take full advantage of this cost-saving approach to enterprise-scale IT. As with public gas and electrical utilities, you pay only for the resources you use, only as you use them. Dedicated computing capacity is centrally supplied from HP data centers and delivered to you on a cost-per-unit basis.

Highly available data center capacity...proven management know-how...strong security safeguards

HP's Flexible Computing Services let you augment your existing infrastructure to provide for predictable usage peaks, accommodate unexpected demand spikes, and handle exceptionally compute-intensive tasks. And you can do so without large upfront capital expenditures or resource commitments, but with confidence that your infrastructure stays secure and the integrity of your confidential data is preserved.

HP's data centers are administered and managed by HP Services specialists. These experienced professionals apply a tested methodology to implement a reliable solution that accommodates your specific needs. Adherence to IT Service Management (ITSM) best practices helps drive delivery of consistently high service levels.

Protective measures at the HP data centers include 24x7 staffing by specially trained security personnel, extensive video monitoring, access controls, advanced intrusion detection and network access monitoring, packet filtering firewalls, routing restrictions, secure VLAN extranets, and secure cell architecture environments.

The HP data center environments are thoroughly "scrubbed" after each use, and each customer organization receives fresh compute power. In addition, the set of CPUs you're assigned is accessible by no other party — not even HP.

Wide scalability and nimble responsiveness for today's Adaptive Enterprise

HP Flexible Computing Services can be leveraged as essential building blocks of an Adaptive Enterprise in which business and IT are synchronized to capitalize on change.

These innovative services deliver key capabilities to help you scale computing power in response to fast-moving business opportunities, cost-effectively align infrastructure capacity with shifting business demands, and profit from the finan-

cial flexibility and agility enabled by pay-per-use utility pricing.

Platforms, applications, and expertise — all geared to your changing needs

Delivering high-performance computing capabilities based on a broad range of hardware platforms, HP Flexible Computing Services are available with all major operating systems and select industry-specific applications. Initial portfolio offerings include:

- **Infrastructure Provisioning Service (IPS):** A highly available, highly secure IT utility service delivered from HP data centers. HP owns the assets, including all hardware, and offers you a choice of operating system environments. Your organization provides and manages the application(s).
- **Infrastructure Provisioning Service plus scheduling (IPS+):** Augments the Infrastructure Provisioning Service with HP installation and management of software such as batch scheduling, compiler, and grid tools to enhance the efficiency of the jobs you're running on the utility.
- **Application Provisioning Service (APS):** Includes Infrastructure Provisioning Service or Infrastructure Provisioning Service plus scheduling. In addition, HP installs key vertical industry application software you supply.
- **Application Provisioning Service for Computer-Aided Engineering:** This complete application utility service includes soft-

ware solutions for structural, crash, and fluid analysis. HP alliances with leading CAE software vendors enable you to access the entire computing stack — hardware, operating system, and applications — on a flexible payment basis.

Looking for a low-cost, low-risk test drive? Join the “Club.”

The innovative HP Flexible Computing Club gives you an easy, affordable way to gauge how this public utility solution

suits your IT and business needs. As a Club member, you’ll enjoy a host of valuable benefits — an introductory pilot project, environment and needs assessment consulting, orientation training to help you get off to a smooth start, expert ongoing guidance from HP Services professionals, and more.

Contact an HP sales representative for details on how to become a Club member and take advantage of this exclusive “try-before-you-buy” opportunity

Engineering Interest FEA Information Feature: KBEC L.C.

Gun Metal Drive – Don't Let The Name Fool You!

Located in Central Texas is a street called Gun Metal Drive. Don't let the name fool you. It isn't where Khanh Bui relocated with his family to become a gunsmith.

Khanh Bui, formerly with LSTC technical support, relocated with his family to Central Texas and is continuing his expertise in LS-DYNA, under his own company KBEC L.C. located on Gun Metal Drive.

Khanh had spent almost 2 years at General Motors working with DYNA3D, 5 years at Lockheed with DYNA3D and LS-DYNA and almost 13 years with LSTC.

KBEC is able to provide sales, technical support and consulting services, along with turn key Linux clusters to run LS-DYNA in Texas and southern state regions.

Distribution & Consulting Channels - January

US Participants

Sales – Support – Training – Benchmark – Consulting.

Engineering Technology Associates, Inc. (ETA) is a software development and engineering company specializing in automotive CAE applications worldwide. ETA's mission is to be the leading global supplier of CAE software, services, training and technology solutions.

DYNAMAX, INC, Located in an automotive environment near Motown Detroit, Dynamax, Inc. has always kept updated in its engineering expertise and understood customer's expectation. With more than ten years professional experience in using the LS-DYNA software to solve customer's problems especially in the automobile industries.

Predictive Engineering: A mechanical engineering consulting company specializing in finite element analysis (FEA). Under this banner, a broad range of capabilities are brought to bear in developing predictive engineering models via expertise in thermal/fluids (CFdesign), drop-testing and impact analysis (LS-DYNA), and static/dynamic/nonlinear/thermal structural analysis (FEMAP / NX.Nastran).

SE&CS: Engineering services to Government and commercial clients. Services include the application, and development, of computational mechanics techniques with specializations in nonlinear transient phenomena and constitutive modeling. Len Schwer, PhD, has over 25 years of experience in the application, and development, of finite element analysis software. With a specialization in the application of the LSTC code LS-DYNA.

Structure Incorporated: A company targeted expressly towards Advanced Analysis, Engineering, and Design. They support the aerospace and industries with expert consulting and contract engineering in the fields of fluid-dynamics, structures, and advanced propulsion. Structure meets the definition of a small business as required for Federal Contracting purposes and particularly specializes in the expert application of NASTRAN and LS-DYNA

EVENTS – 2006

If you want your event listed please send the information to:
mv@feainformation.com

2006	
Feb 22-23	CEI Visualization Conference – Orlando, FL. US
April 24-26	MSC.Software 2006 Americas VPD Conference Detroit, MI - US
May 02-04	2006 International ANSYS Conference Pittsburgh, PA - US
June 04-06	9th International LS-DYNA Users Conference Dearborn, MI - US
July 02-06	ICSV13 Vienna - Vienna, Austria
July 5-7	HEAT TRANSFER 2006 -Ninth International Conference on Advanced Computational Methods and Experimental Measurements in Heat and Mass Transfer - The New Forest, UK
Oct 12-13	LS-DYNA Users Meeting - Hosted by DYNAmore Ulm, Germany
Oct 25-27	2006 CADFEM Users Meeting – International Congress on FEM Technology – Stuttgart area - Germany
Nov 14- 16	Aerospace Design Expo 06 - Anaheim, CA - US

LS-DYNA Resource Page

Participant Software Interfacing or Embedding LS-DYNA

Each software program can interface to all, or a very specific and limited segment of the other software program. The following list are software programs interfacing to or having the LS-DYNA solver embedded within their product. For complete information on the software products visit the corporate website.

ANSYS - ANSYS/LS-DYNA

www.ansys.com/products/environment.asp

ANSYS/LS-DYNA - Built upon the successful ANSYS interface, ANSYS/LS-DYNA is an integrated pre and postprocessor for the worlds most respected explicit dynamics solver, LS-DYNA. The combination makes it possible to solve combined explicit/implicit simulations in a very efficient manner, as well as perform extensive coupled simulations in Robust Design by using mature structural, thermal, electromagnetic and CFD technologies.

AI*Environment: A high end pre and post processor for LS-DYNA, AI*Environment is a powerful tool for advanced modeling of complex structures found in automotive, aerospace, electronic and medical fields. Solid, Shell, Beam, Fluid and Electromagnetic meshing and mesh editing tools are included under a single interface, making AI*Environment highly capable, yet easy to use for advanced modeling needs.

ETA – DYNAFORM

www.eta.com

Includes a complete CAD interface capable of importing, modeling and analyzing, any die design. Available for PC, LINUX and UNIX, DYNAFORM couples affordable software with today's high-end, low-cost hardware for a complete and affordable metal forming solution.

ETA – VPG

www.eta.com

Streamlined CAE software package provides an event-based simulation solution of nonlinear, dynamic problems. eta/VPG's single software package overcomes the limitations of existing CAE analysis methods. It is designed to analyze the behavior of mechanical and structural systems as simple as linkages, and as complex as full vehicles

MSC.Software "MSC.Dytran LS-DYNA"

www.msc.software.com

Tightly-integrated solution that combines MSC.Dytran's advanced fluid-structure interaction capabilities with LS-DYNA's high-performance structural DMP within a common simulation environment. Innovative explicit nonlinear technology enables extreme, short-duration dynamic events to be simulated for a variety of industrial and commercial applications on UNIX, Linux, and Windows platforms. Joint solution can also be used in conjunction with a full suite of Virtual Product Development tools via a flexible, cost-effective MSC.MasterKey License System.

Side Impact With Fuel Oil Inside

MSC.Software - MSC.Nastran/SOL 700

The MSC.Nastran™ Explicit Nonlinear product module (SOL 700) provides MSC.Nastran users the ability access the explicit nonlinear structural simulation capabilities of the MSC.Dytran LS-DYNA solver using the MSC.Nastran Bulk Data input format. This product module offers unprecedented capabilities to analyze a variety of problems involving short duration, highly dynamic events with severe geometric and material nonlinearities.

MSC.Nastran Explicit Nonlinear will allow users to work within one common modeling environment using the same Bulk Data interface. NVH, linear, and nonlinear models can be used for explicit applications such as crash, crush, and drop test simulations. This reduces the time required to build additional models for another analysis programs, lowers risk due to information transfer or translation issues, and eliminates the need for additional software training.

MSC.Software – Gateway for LS-DYNA

Gateway for LS-DYNA provides you with the ability to access basic LS-DYNA simulation capabilities in a fully integrated and generative way. Accessed via a specific Crash workbench on the GPS workspace, the application enhances

CATIA V5 to allow finite element analysis models to be output to LS-DYNA and then results to be displayed back in CATIA. Gateway for LS-DYNA supports explicit nonlinear analysis such as crash, drop test, and rigid wall analysis.

Gateway products provide CATIA V5 users with the ability to directly interface with their existing corporate simulation resources, and exchange and archive associated simulation data.

Oasys software for LS-DYNA
www.arup.com/dyna

Oasys software is custom-written for 100% compatibility with LS-DYNA. Oasys PRIMER offers model creation, editing and error removal, together with many specialist functions for rapid generation of error-free models. Oasys also offer post-processing software for in-depth analysis of results and automatic report generation.

EASI -CRASH DYNA
www.esi-group.com/SimulationSoftware/EASi_CRASH-DYNA

Interfaced to the latest version of LS-DYNA Easi-CRASH DYNA supports LS-DYNA Version 970. EASi-CRASH DYNA has powerful editing features, such as automesh and remesh.

LS-DYNA/MADYMO coupling capabilities for pre- and post processing. With direct read in of LS-DYNA® data it has highly optimized loading and animation of LS-DYNA results for design

Website: www.feainformation.com

NEC

The SX-8 Series, that implements an eight-way SMP system in a very compact node module and uses an enhanced version of the single chip vector processor that was introduced with the SX-6, is NEC's latest and most powerful supercomputer

EASi-CRASH DYNA - a fully integrated package for crash simulation which covers the CAE-process from start to finish. It achieves this by integrating all aspects of model building, dataset preparation, result evaluation and design comparisons. EASi-CRASH DYNA can be used for concept crash, FE crash and coupled rigid body/FE crash simulations in conjunction with solvers like LS-DYNA

The IBM® **@server**Blue Gene® Solution is the result of an IBM supercomputing project begun over five years ago, dedicated to building a new family of supercomputers optimized for bandwidth, scalability and the ability to handle large amounts of data while consuming a fraction of the power and floor space required by today's fastest systems.

9th International LS-DYNA Users Conference

Monthly Update - Publications

Publications – Dr. Wayne L. Mindle - papers@lstc.com

In the February Issue we will list the FEA Information Participant Sponsors that will be Exhibitors at the Conference.

The deadline for submitting abstracts for the upcoming LS-DYNA Conference was January 2nd. I would like to thank all of those that submitted abstracts. Official acceptance of abstracts will be sent out by January 27, 2006. Sessions will be announced shortly thereafter.

Once again, the "LS-DYNA User Community" encompasses a wide range of applications. The range of topics in submitted papers includes the following areas of interest.

- Automotive Design and Manufacturing
- Crashworthiness
- Occupant Safety
- Barrier Design
- Metal Forming
- Composites
- Fracture Mechanics
- ALE Applications
- Hardware Performance
- Biomedical Applications
- Explosive Impact
- General Impact Analysis
- Vibration Analysis
- Drop Testing
- Theory – Element Development and Material Modeling
- Optimization
- SPH and Mesh-Free Applications
- Bird-Strike
- Civil Engineering Applications
- Material Testing
- Pre-Processing

A CD of the papers will be available from LSTC including mailing world-wide at no charge. You will be able to sign up for the CD in April on the website www.ls-dynaconferences.com

Registration is now available on line at www.ls-dynaconferences.com
